Student Work Assistant

Strategic Recommendations

DSS5105 Group 09 | Higher education and student services

1 Strategic focus and opportunity selection

Develop three focused student services: review course changes, confirm group commitments, and follow up multi-step administrative requirements. Each turns unstructured messages into a source-linked decision the student can check. GenAI interprets the language; explicit states and student review control what becomes an obligation. These are proposed extensions of Student Work Assistant.

The target is the handoff between receiving information and knowing what to do next. Table 1 ranks the opportunities by relevance to the current user, consequence of misunderstanding, and reuse of existing components. The initial versions use selected emails, text-based documents and pasted notes. They require no new model training, LMS connection or campus-wide rollout.

Priority / user	Decision worth improving	Smallest useful implementation
1. Course changes / students managing several courses	Which deadline or requirement is current, and what changed?	Link messages to a deliverable; show old and proposed values beside their sources.
2. Group commitments / project teams	Who accepted which action, by when?	Extract actions from imported notes; record explicit acknowledgement before personal planning.
3. Administrative follow-up / incoming students	Which required steps remain open after a notice or receipt?	A personal checklist linking each step to an instruction and completion evidence.

Table 1: Three student-service opportunities, ordered by fit and component reuse.

2 Opportunity 1: review course changes

User and demand evidence. Students managing several courses need to identify relevant instructions before deciding which date applies. A qualitative University of Leeds study interviewed staff and 17 students. Students described excessive, duplicated or irrelevant email and difficulty finding important information; they wanted shorter, more relevant communication[1]. This supports a focused course-action view rather than another general inbox summary.

Existing alternative and specific need. A student can copy a date into Google Tasks, use a planner, or search the original thread. The proposed service addresses the next question: when another notice arrives, which existing obligation does it change? Our saved real-mail evaluation contains five duplicate entries among 25 scored dated tasks; the sample also contains an explicit 24-hour extension[5]. These examples identify a concrete reconciliation problem to solve.

Expected impact. Make superseded dates and unresolved contradictions visible before the student commits study time. The useful output is one reviewed obligation with its revision history. Assess its value through source-lookup and correction time, missed requirements and duplicate tasks.

Low-effort implementation. Reuse mail intake, source quotes, task review and the planner. Add a deliverable identifier and revision records. GenAI proposes whether two messages concern the same work and explains the change; the student accepts the link and authoritative date. The preview then shows the effect on the plan. Start with one course and selected notices, including extensions and receipts. This isolates the new work to linking, revision display and review.

3 Opportunity 2: confirm group commitments

User and demand evidence. Student project teams need an agreed action list after discussions. Wang et al.'s 2025 study includes a student-led review of group-project practice at Imperial College London. Interviews identified unclear tasks, mismatched expectations, coordination difficulties and scheduling conflicts. One reported case required the group to rework an assignment two days before submission following ineffective task division[2]. This is evidence of a coordination problem with consequences for deadline pressure and rework.

Existing alternative and specific need. Teams can maintain a shared task board or use meeting notes. Microsoft Facilitator already captures meeting information, and its Planner task-tracking integration is in public preview. The proposed service focuses on the review step: distinguish a suggestion from a decision, retain unresolved questions, and obtain acknowledgement from the named owner before adding work to a personal plan.

Expected impact. Detect disagreements about responsibility before they become last-minute rework. The output is a short list of accepted actions, owners, dates and source quotations. Track incorrect owner assignments, unacknowledged actions and the effort needed to prepare the next meeting's status update. Acknowledgement documents an agreement; it does not establish how much work a member eventually contributes.

Low-effort implementation. Reuse the group-text importer, source references, review controls and planner. Add proposed, accepted, completed and superseded states. In the first version, the team reviews an imported discussion together and the student records each owner's acknowledgement. This avoids building a meeting bot or a multi-user workspace. Accepted work is then offered in the existing personal planning preview.

Route to users. Recruit volunteer course-project teams and approach module coordinators to sponsor a class pilot. Students review the actions and keep control over which accepted work enters their own plans.

4 Opportunity 3: follow up administrative requirements

User and demand evidence. Incoming students must turn instructions from different offices into completed steps. Corwin et al.'s 2026 study draws on a three-year research-practice partnership across two US campuses. The authors' research summary reports that redundant or unclear email can obscure actionable messages about registration, financial aid and academic standing[3]. Locally, NUS describes onboarding as an email-invited process with separate check-in and onboarding steps; graduate student-card instructions also come from programme administrators[4]. These sources support a practical need for following a process through, beyond reading its first notification.

Existing alternative and specific need. Institutional portals remain the authority. Navigate360 already provides school to-dos, holds and notifications at partner institutions. The proposed personal view links the student's selected notices and receipts to individual checklist steps. A receipt for one step must not close every requirement in the process.

Expected impact. Help the student see what is still pending and which office or source to consult next. The target is fewer overlooked required steps and fewer unnecessary repeat submissions. Measure correct step states, missed requirements and time spent reconstructing the process from messages.

Low-effort implementation. Seed one checklist from a published guide and let the student review it. Reuse extraction, evidence links and draft review; add step IDs and links to acknowledgements. GenAI proposes which step a message concerns. Completion comes from explicit evidence or student confirmation. The first version stores step labels and dates, excludes identity and medical attachments, and leaves submissions and official status changes in the portal.

5 Competitive position and adoption

Existing tools cover planning, meeting capture and campus reminders. Table 2 locates our focus: reviewing which version applies, who accepted work and which steps remain pending. Product names link to the official documentation used in the comparison.

Alternative	Documented offer	Recommended focus
Google Tasks / Outlook Copilot	Mail-to-task or email/calendar assistance.	Source-linked review when a later notice changes an existing obligation.
MyStudyLife Scout / Reclaim	Weekly study planning or automatic scheduling; Reclaim offers a free tier.	Settle the obligation and its evidence before scheduling it.
Teams Facilitator	Collaborative meeting notes; Planner task tracking in public preview.	Review acceptance of ownership across imported discussions.
Navigate360 Student	School to-dos, holds and notifications, dependent on an institutional partnership.	A student-controlled checklist linked to selected instructions and receipts.

Table 2: Coverage described by selected product documentation, accessed 13 November 2026.

Positioning. Use the project's evidence links, local storage and content-bound approval[5] to make obligation changes, ownership and completion inspectable. Market scarcity and willingness to pay remain research questions.

Adoption and funding. Offer free additions to the existing assistant, starting with selected imports and setup help at one course or onboarding session. Approach programme offices, module coordinators and student-support teams as pilot sponsors. Base any later support pricing on measured setup costs and user demand.

Implementation priority. Preserve candidate status and date roles and reject unsafe suggestions before adding cross-message linking; the current handoff can promote conditional candidates to required work[5]. Share evidence, review and state history across services. Use payload review, minimal data retention and content-bound approval for external writes.

Decision test. After the reliability fixes, compare both versions on the same fresh, independently labelled examples. Plan matched review tasks with 8–12 volunteers against their existing workflow, counting setup, import, lookup, correction and confirmation time. Continue if median paired active time falls by at least 30% without more missed required actions; otherwise narrow or stop the feature. This is a proposed pilot rule.

Research sources
